

Background-reference probability audit | 60-100 MeV detail

- Gaussian local
- GP global (200,000)
- Direct scans (1,000)
- $r \leq 0$: local/global = 1

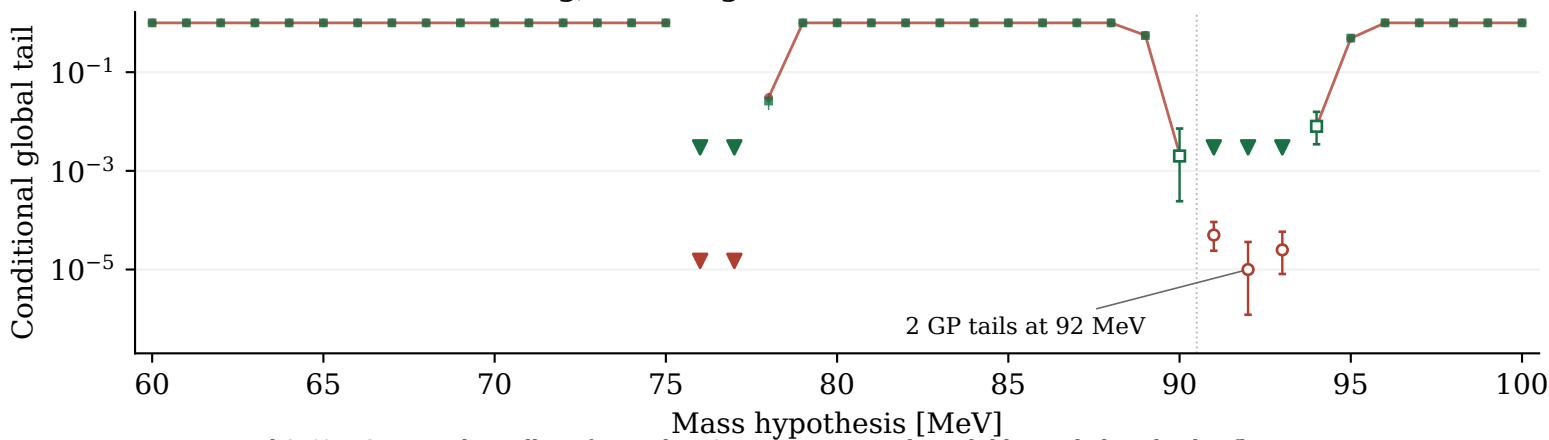

Why centering can change the apparent significance

Relative to the reference: Gaussian approximation and direct counts

Same reference and ordering, including the scan over all 232 masses

Bars: central 95% MC intervals. Hollow: fewer than 25 tails. $\blacktriangledown$: upper bound; blue $\blacktriangledown$: below display floor.
