

Optimizer-repeat gate and exclusion audit

Selection uses GP log marginal likelihood and branch reproducibility, never pull size or sign

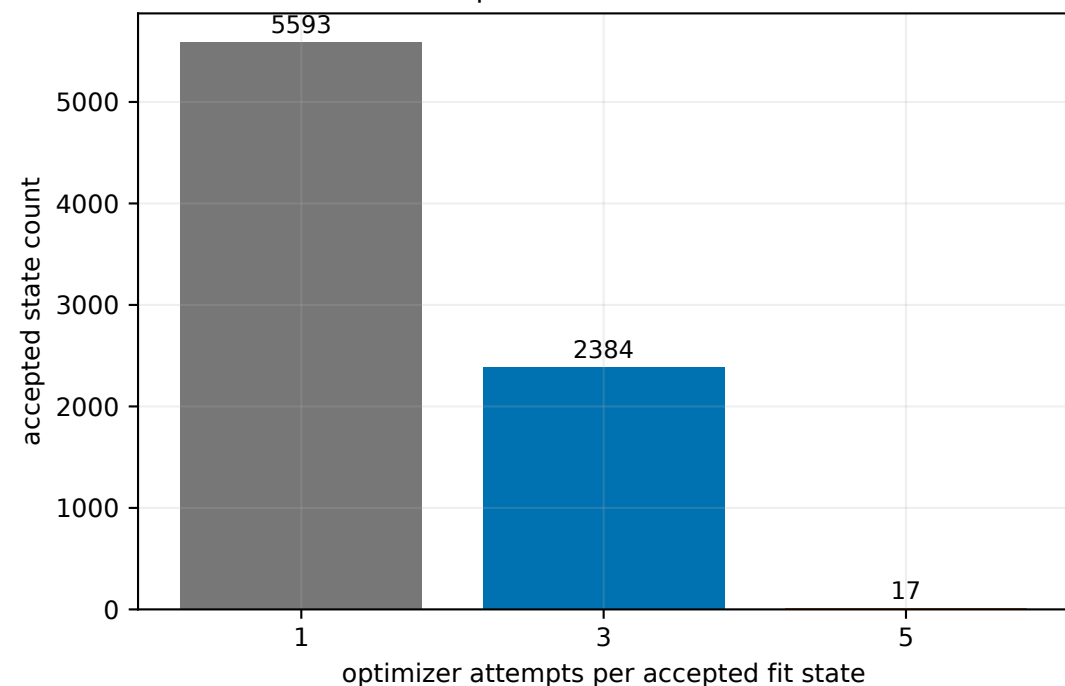

Effect of numerical branch selection

Accepted factor-15 contacts

Adaptive restart workload

Predeclared fit-state exclusions (6 / 8000):

1%-source $\times 100$, toy 83, 90 MeV, 3σ : one row
no reproducible valid covariance branch in five attempts

10%-source $\times 10$, toy 28, 180 MeV, 5σ : one row
unreplicated near-upper-bound branch in five attempts

10%-source $\times 10$, toy 66, 90 MeV: all four strengths
irreproducible matched background/reference branch

All affected cells retain 99 accepted toys.
Statistical extremes passing the pull-blind technical gate remain included.
Repeat-triggered boundary fits remain only when replicated.
