

Pull-blind length-ceiling pilot: factor 20 fails; common conditional ceiling = 25

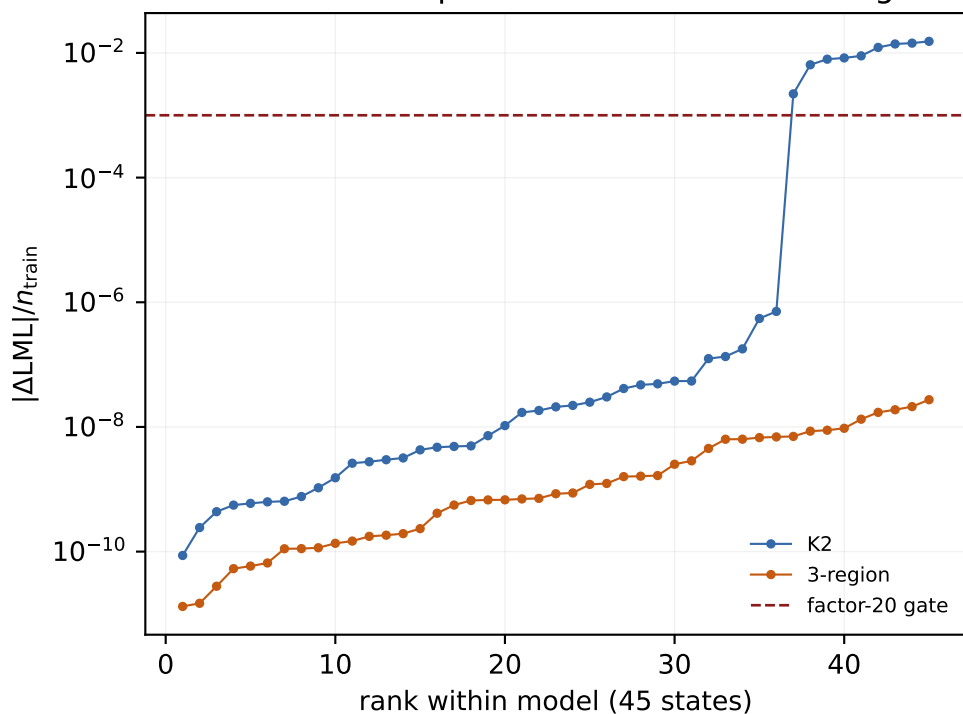

Exact or near upper-length contacts (9 states/cell)

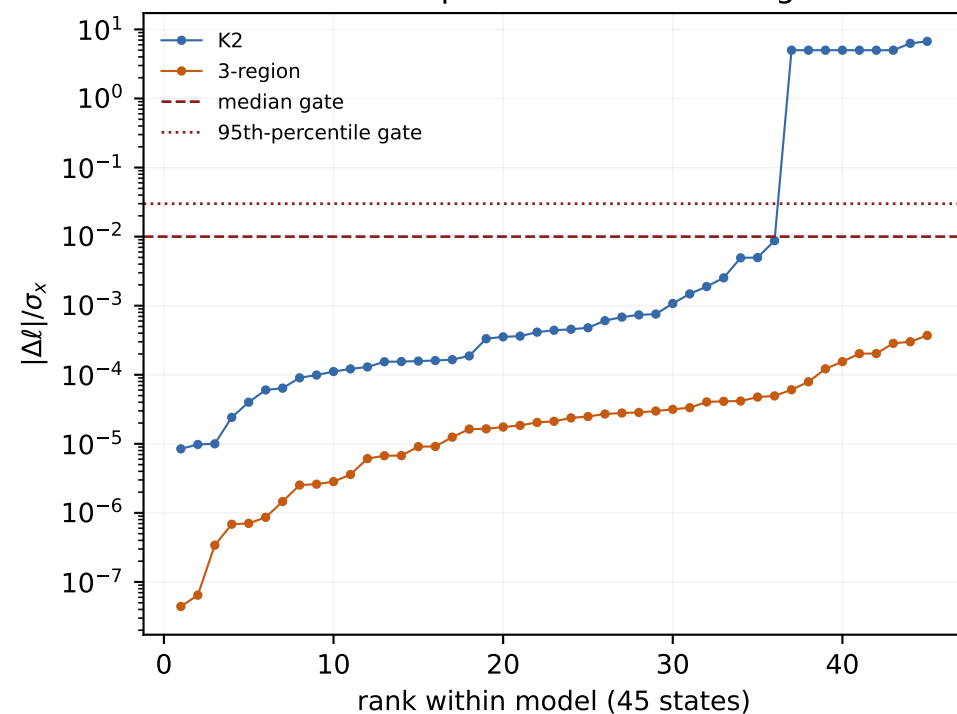

Minimum reproduced top-branch multiplicity

Ranked same-input factor 20→25 LML changes

Ranked same-input factor 20→25 length shifts

Factor-20 contacts=7; max $|\Delta \text{LML}|/n_{\text{train}}=0.01535$; median/p95 $|\Delta \ell|/\sigma_x=8.47\text{e-}05/5$. No pulls, amplitudes, p-values, recovery, or limits were inspected.
