

Requested four-lane 25-toy study for the rejected nominal candidate - intentionally not run

The fSigPowExpQ source generator was rejected (native-10% Pearson chi2/ndf about 6.17; bound contact).
The provisional degree-18 replacement passes a broad in-sample engineering screen but fails predictive gates:
1% source: blocked-CV deviance/bin 18.107; max fake-gap shift 2.679 sigma
native 10%: blocked-CV deviance/bin 24.045; max fake-gap shift 9.889 sigma
required: ≤ 1.25 and ≤ 0.20 sigma

Its current numerical fit also lacks the required multistart/stationarity certificate.
For this rejected nominal branch, toy generation and Figures 48/136 remain blocked.
The later sparse conditional-stress branch is separate and has no card/bound-selection authority.
This is a fail-closed scientific result, not a missing plotting job.
