

65 MeV scope check: the shift is carried by the 2021 likelihood block

2015 and 2016 blocks held at their v4.2 states; only the 2021 block is replaced

Orange points are controlled single-mass hybrids, not an official combined scan.

Diagnostic only: p0 and Z are local/asymptotic. Support x kernel and combined-scope swaps are controlled counterfactuals, not trials-corrected significance or coverage calibration. These plots are not an exclusion and do not prove that the feature is signal or background.
