

Relative background-only yield noise
after response scaling

Relative background-only yield noise
after response scaling

2021 10% | Signal MC at $A = 3$ s0 on the GP mean background source | 100 evaluation toys

Bars: 95% percentile intervals from 2,000 whole-toy bootstrap resamples.

Resampling keeps masses, signal strengths and window choices together; pilot scale is fixed.

Ratio = $[\text{SD}(\text{background-only fitted yield}) / \text{signal response}] / \text{baseline value}$. Lower is better.
