

- Shifted Gaussian: original window
- Shifted Gaussian: [-4, 3]
- Common shape: [-4, 3]
- Neighbor interpolation: [-4, 3]
- Direct signal MC: [-4, 3]

2021 10% | 100 calibration and 100 independent evaluation toys per source | Full v16 TC MC injection

How to read: a lower left value is a smaller accepted-yield endpoint; a higher right value is more signal detection.

Left: coarse-grid medians, no error bars; empty sets are omitted, never set to zero. Endpoint flags are tabulated.

Right: exact two-sided 95% Clopper-Pearson intervals, denominator 100, conditional on the saved calibration.

Calibration is source matched and uses the full direct MC truth. These are local conditional tests, not discovery claims.

$u = (\text{reconstructed mass} - \text{predicted core center}) / \text{core width}$; $s_0 = \text{archived Gaussian yield-error scale}$.
