

Selected mass spectrum

Counts and bin edges
for one campaign

Narrow-signal fit

Gaussian signal template
+ profiled GP background

Signal yield

Extract $\hat{A}$ and uncertainty
or solve $CL_s(A_{90}) = 0.10$

Coupling conversion

Use campaign factor $K_d(m)$
 $\hat{\varepsilon}^2 = \hat{A}/K_d$; $\varepsilon_{90}^2 = A_{90}/K_d$
