

2021 10% | 100 independent evaluation toys per source | Full v16 TC signal-MC injection at $A = 3 s_0$
 How to read: response 1 returns the added full yield; a right-panel ratio below 1 means smaller yield noise.
 Mean bars: sample standard errors. Ratio bars: 95% intervals from 2,000 whole-toy bootstrap resamples;
 resampling preserves mass, strength and policy correlations. Sources use separate streams. Pilot scale is fixed.
 The candidate was selected using separate tuning toys; these evaluation toys did not choose the window.
 $u = (\text{reconstructed mass} - \text{predicted core center}) / \text{core width}$; $s_0 = \text{archived Gaussian yield-error scale}$.
