

— 80 MeV signal MC - - 100 MeV signal MC — 90 MeV: neighboring-anchor prediction

2021 v16 TC signal MC; 90 MeV prediction: $c=87.895$ MeV, $s=1.745$ MeV

Core: align each anchor before interpolation

Tails: retain their measured probability

How to read the figure. At 90 MeV, each aligned CDF receives weight 1/2; center and width also interpolate halfway. Shading marks the proposed $[-4, 3]$ blind region. Areas use all selected signal MC, including overflow in the denominator. Lines have no uncertainty bands. This is a conditional prediction, because no independent 90 MeV signal-MC sample is available.
