

2021 10% | v16 TC signal-MC injections | Neighbor-interpolated extraction templates | 100 tuning toys
 How to read: smaller lower-panel values indicate better precision; the upper panel is deterministic signal leakage.
 Lower bars: 95% percentile intervals from 2,000 whole-toy bootstrap resamples, preserving masses and policies.
 Response $R = \text{mean}(\text{fitted yield with signal} - \text{background-only fitted yield}) / \text{injected full yield } A$; $A = 3 \text{ s0}$.
 Noise = sample SD(background-only fitted yield) / R . Shortening a template never renormalizes its probability.
 $u = (\text{reconstructed mass} - \text{predicted core center}) / \text{core width}$; $s0 = \text{archived Gaussian yield-error scale}$.
