

A 30% checkpoint before opening the full 2021 sample

Illustrative persistence of the selected common-fit rate at 66 and 92 MeV | 2015 and 2016 stay fixed

- Observed 10% residual
- Only background in added data (mean)
- Selected rate persists (mean)
- Added-sample background counting SD

Future panels are conditional expectations. Cumulative panels retain the actual first 10%; y-axis ranges differ to show the change in event yield.

The 92 MeV rates differ between years. These selected-rate examples omit background-model uncertainty; future data and global significances are not supplied.
